The CC722 is the largest mass-produced vibratory tandem roller in the world.

This machine generally achieves the required density after just a few runs, even when compacting thick layers of asphalt, roller-compactd concrete or thick asphalt mixtures. The larger diameter of the drums also makes the machine suitable for work with softer mixtures, despite the service weight of 17 tons.

Introduction

Warning symbols

**WARNING !** Marks a danger or a hazardous procedure that can result in life threatening or serious injury if the warning is ignored.

**CAUTION !** Marks a danger or hazardous procedure that can result in damage to the machine or property if the warning is ignored.

Safety information

The safety manual supplied with the machine must be read by all roller operators. Always follow the safety instructions. Do not remove the manual from the machine.

We recommend that the operator reads the safety instructions in this manual carefully. Always follow the safety instructions. Ensure that this manual is always easily accessible.

Read the entire manual before starting the machine and before carrying out any maintenance.

Ensure good ventilation (extraction of air by fan) where the engine is run indoors.

**CALIFORNIA**

**Proposition 65 Warning**

Diesel engine exhaust and some of its constituents are known to the State of California to cause cancer, birth defects, and other reproductive harm.

General

This manual contains instructions for machine operation and maintenance.
The machine must be correctly maintained for maximal performance.

The machine should be kept clean so that any leakages, loose bolts and loose connections are discovered at as early a point in time as possible.

Inspect the machine every day, before starting. Inspect the entire machine so that any leakages or other faults are detected.

Check the ground under the machine. Leakages are more easily detected on the ground than on the machine itself.

![THINK ENVIRONMENT ! Do not release oil, fuel and other environmentally hazardous substances into the environment. Always send used filters, drain oil and fuel remnants to environmentally correct disposal.]

This manual contains instructions for periodic maintenance normally carried out by the operator.

![Additional instructions for the engine can be found in the manufacturer's engine manual.]
Safety - General instructions

(Also read the safety manual)

1. The operator must be familiar with the contents of the OPERATION section before starting the roller.

2. Ensure that all instructions in the MAINTENANCE section are followed.

3. Only trained and/or experienced operators are to operate the roller. Passengers are not permitted on the roller. Remain seated at all times when operating the roller.

4. Never use the roller if it is in need of adjustment or repair.

5. Only mount and dismount the roller when it is stationary. Use the intended grips and rails. Always use the three-point grip (both feet and one hand, or one foot and both hands) when mounting or dismounting the machine. Never jump down from the machine.

6. The ROPS (Roll Over Protective Structure) should always be used when the machine is operated on unsafe ground.

7. Drive slowly in sharp bends.

8. Avoid driving across slopes. Drive straight up or straight down the slope.

9. When driving close to edges, ditches or holes, make sure that at least 2/3 of the drum width is on previously compacted material (solid surface).

10. Make sure that there are no obstacles in the direction of travel, on the ground, in front of or behind the roller, or overhead.

11. Drive particularly carefully on uneven ground.

12. Use the safety equipment provided. The seat belt must be worn on machines fitted with ROPS.

13. Keep the roller clean. Clean any dirt or grease that accumulates on the operator platform immediately. Keep all signs and decals clean and legible.

14. Safety measures before refueling:
   - Shut off the engine
   - Do not smoke
   - No naked flame in the vicinity of the machine
   - Ground the filling device nozzle to the tank to avoid sparks

15. Before repairs or service:
   - Chock the drums/wheels and under the strike-off blade.
   - Lock the articulation if necessary
16. Hearing protection is recommended if the noise level exceeds 85 dB(A). The noise level can vary depending on the equipment on the machine and the surface the machine is being used on.

17. Do not make any changes or modifications to the roller that could affect safety. Changes are only to be made after written approval has been given by Dynapac.

18. Avoid using the roller before the hydraulic fluid has reached its normal working temperature. Braking distances can be longer than normal when the fluid is cold. See instructions in the STOP section.

19. For your own protection always wear:
   - helmet
   - working boots with steel toecaps
   - ear protectors
   - reflecting clothing/high visibility jacket
   - working gloves
Safety - when operating

Driving near edges
When driving near an edge, minimum 2/3 of the drum width must be on solid ground.

Keep in mind that the machine’s center of gravity moves outwards when steering. For example, the center of gravity moves to the right when you steer to the left.

Where possible, avoid driving across slopes. Drive instead straight up and down sloping ground.

Slopes
This angle has been measured on a hard, flat surface with the machine stationary.

The steering angle was zero, the vibration was switched OFF and all tanks were full.

Always take into consideration that loose ground, steering the machine, vibration on, machine speed across the ground and raising the center of gravity can all cause the machine to topple at smaller slope angles than those specified here.

To exit the cab in an emergency, use one of the doors or the windshield, which can be opened.

It is recommended that ROPS (Roll Over Protective Structure) or a ROPS-approved cab is always used when driving on slopes or unsafe ground.
Safety (Optional)

Air conditioning (Optional)

⚠ The system contains pressurized refrigerant. It is forbidden to release refrigerants into the atmosphere.

⚠ Work on the refrigerant circuit is only to be carried out by authorized companies.

⚠ The cooling system is pressurized. Incorrect handling can result in serious personal injury. Do not disconnect or undo the hose couplings.

⚠ The system must be refilled with an approved refrigerant by authorized personnel when necessary. Refer to the technical specifications.
Special instructions

Standard lubricants and other recommended oils and fluids

Before leaving the factory, the systems and components are filled with the oils and fluids specified in the lubricant specification. These are suitable for ambient temperatures in the range -15°C to +40°C (5°F - 104°F).

⚠ The maximum temperature for biological hydraulic fluid is +35°C (95°F).

Higher ambient temperatures, above +40°C (104°F)

For operation of the machine at higher ambient temperatures, however maximum +50°C (122°F), the following recommendations apply:

The diesel engine can be run at this temperature using normal oil. However, the following fluids must be used for other components:

Hydraulic system - mineral oil Shell Tellus T100 or similar.

Other components that use transmission oil: Shell Spirax AX 85W/140 or equivalent.

Temperatures

The temperature limits apply to standard versions of rollers.

Rollers equipped with additional equipment, such as noise suppression, may need to be more carefully monitored in the higher temperature ranges.

High pressure cleaning

Do not spray water directly onto electrical components or the instrument panels.

Place a plastic bag over the fuel filler cap and secure with a rubber band. This is to avoid high pressure water entering the vent hole in the filler cap. This could cause malfunctions, such as the blocking of filters.

⚠ Never aim the water jet directly at the fuel tank cap. This is particularly important when using a high-pressure cleaner.
Fire fighting
If the machine catches fire, use an ABE-class powder fire extinguisher.
A BE-class carbon dioxide fire extinguisher can also be used.

Roll Over Protective Structure (ROPS), ROPS approved cab

If the machine is fitted with a Roll Over Protective Structure (ROPS, or ROPS approved cab) never carry out any welding or drilling in the structure or cab.

Never attempt to repair a damaged ROPS structure or cab. These must be replaced with new ROPS structure or cabs.

Battery handling

When removing batteries, always disconnect the negative cable first.

When fitting batteries, always connect the positive cable first.

Dispose of old batteries in an environmentally friendly way. Batteries contain toxic lead.

Do not use a quick-charger for charging the battery. This may shorten battery life.
Jump starting

Do not connect the negative cable to the negative terminal on the dead battery. A spark can ignite the oxy-hydrogen gas formed around the battery.

Check that the battery used for jump starting has the same voltage as the dead battery.

Turn the ignition and all power consuming equipment off. Switch off the engine on the machine which is providing jump start power.

First connect the jump start battery's positive terminal (1) to the flat battery's positive terminal (2). Then connect the jump start battery's negative terminal (3) to, for example, a bolt (4) or the lifting eye on the machine with the flat battery.

Start the engine on the power providing machine. Let it run for a while. Now try to start the other machine. Disconnect the cables in the reverse order.

Fig. Jump starting
Vibrations - Operator station  
(ISO 2631)

The vibration levels are measured in accordance with the operational cycle described in EU directive 2000/14/EC on machines equipped for the EU market, with vibration switched on, on soft polymer material and with the operator's seat in the transport position.

| Measured whole-body vibrations are below the action value of 0.5 m/s² as specified in Directive 2002/44/EC. (Limit is 1.15 m/s²) |
| Measured hand/arm vibrations also were below the action level of 2.5 m/s² specified in the same directive. (Limit is 5 m/s²) |

Noise level

The noise level is measured in accordance with the operational cycle described in EU directive 2000/14/EC on machines equipped for the EU market, on soft polymer material with vibration switched on and the operator's seat in the transport position.

- Guaranteed sound power level, $L_{WA} = 111$ dB (A)
- Sound pressure level at the operator's ear (platform), $L_{PA} = xx$ dB (A)
- Sound pressure level at the driver's ear (cab), $L_{PA} = 88 \pm 3$ dB (A)

Machine plate - Identification

Machine plate

The machine type plate (1) is affixed on the left front edge of the operator's platform.

The plate specifies the manufacturer's name and address, the type of machine, the PIN product identification number (serial number), service weight, engine power and year of manufacture. If the machine is delivered outside of the EU, the sign may lack CE marking and year of manufacture.

Please state the machine's PIN (serial number) when ordering parts.

Product identification number on the frame

The machine PIN (Product Identification Number) (1) is punched on the right edge of the front frame.
Explanation of 17PIN serial number

A = Manufacturer
B = Family/Model
C = Check letter
D = No coding
E = Production unit
F = Serial number

B, E and F are normally used for inquiries and ordering of spare parts.

Engine plates

The engine's type plate (1) is located on top of the cylinder head cover.

The plate specifies the type of engine, its serial number and the engine specification.

Please specify the engine serial number when ordering spares. Refer also to the engine manual.

18. Hydraulic fluid level 272373

Safety decals

903422
Warning - Crush zone, articulation/drum.
Maintain a safe distance from the crush zone.
(Two crush zones on machines fitted with pivotal steering)

903423
Warning - Rotating engine components.
Keep your hands at a safe distance from the danger zone.

903424
Warning - Hot surfaces in the engine compartment.
Keep your hands at a safe distance from the danger zone.

904895
Warning - Brake disengagement
Study the towing chapter before disengaging the brakes.
Danger of being crushed.

903459
Warning - Instruction manual
The operator must read the safety, operation and maintenance instructions before operating the machine.

908229
Warning - Locking
The articulation must be locked when lifting.
Read the instruction manual.
904165
Warning - Toxic gas (accessory, ACC)
Read the instruction manual.

Control panel, air conditioning (optional)

The fan and AC switch (1) must be in the AC ON position to enable the fan switch (2) to work.

Ventilation: Set the switch (1) in the middle position to run the fan at low speed without AC.
Cooling: Set the switch (1) in the low position, AC ON, to run the fan at low speed with AC.
The fan speed can be increased in two steps with the changeover switch (2).
Adjust the temperature with the thermostat control (3).

Relays in engine compartment

The machine is equipped with a 12V electrical system and an AC alternator.

⚠️ Connect the correct polarities (ground) to the battery. The cable between the battery and the alternator must not be disconnected when the engine is running.
Relays in control column

1. Flasher relay
2. Sprinkler relay
3. Over-rev relay
4. VBS relay
Operation - Starting

Before starting

Master switch - Switching on

Remember to carry out daily maintenance. Refer to the maintenance instructions.

The battery master switch is located on the left side of the machine. Turn the key knob (1) to the on position. The entire roller is now supplied with power.

Water tanks - Level

When driving on asphalt, check that the water tanks are filled. See the relevant level gauges (1).

Control table - Setting

Depress the control table's locking pedal (1) and set it to the desired position. Release the pedal and check that the control table is locked in position before driving.
Operator's seat - Adjusting

Adjust the operator’s seat so that the position is comfortable and so that the controls are within easy reach.

The seat can be adjusted as illustrated.

Always make sure that the seat is secure before beginning operation.

Interlock (Optional)

The roller can be equipped with Interlock.

The engine switches off 7 seconds after the operator rises from the seat.

The engine stops whether the forward/reverse lever is in the neutral or the drive position.

The engine does not stop if the parking brake is activated.

Sit down for all operations!
Instruments and lamps - Checking

Turn the starter switch (7) to position I. All warning lamps should light for about 5 seconds and the beeper should sound. During this time, make sure that the warning lamps light.

Check that the warning lamps for charging (21), oil pressure (28) and parking brake (29) light.

The hourmeter (25) records the number of hours as long as the engine is running.

Parking brake - Check

Make sure that the emergency/parking brake knob (1) really is in the depressed position. The roller can start to roll when the engine is started on sloping ground, if the parking brake is not applied.
**Speed limiter**

The machine is equipped with an adjustable speed limiter that can be disengaged during transport driving.

Undo the locking knob (1) on the limiter. Adjust the forward/reverse lever to the desired speed and lock the knob in this position.

If the speed limiter knob (2) is pulled out, the forward/reverse lever can be moved past the limits.

---

**View**

Before starting, make sure that the view forwards and backwards is unobstructed.

All cab windows should be clean and the rear view mirrors should be correctly adjusted.
Operator's station

Always fasten the seat belt (1) that is provided if a ROPS (Roll Over Protective Structure) is fitted on the roller, and wear a protective helmet.

*Always replace the seat belt (1) with a new one if it is worn or has been subjected to a heavy load.*

Always replace the seat belt (1) with a new one if it is worn or has been subjected to a heavy load.

Check that rubber elements (2) on the platform are intact. Worn elements will impair comfort.

If the machine is fitted with a cab, make sure that the doors are closed when in motion.

Make sure that anti-slip (3) on the platform is in good condition. Replace with new anti-slip if friction is poor.
Starting

Starting the engine

Set the forward/reverse lever (1) in neutral. The engine can only be started when the lever is in neutral.

Set the engine speed control (2) to idling.

Set the vibration switch (4) for manual/automatic vibration in the mid position (position 0).

Turn the starter switch (3) to the right to the first position. A lamp in the knob comes on. When the lamp goes out, turn the knob to the start position and release immediately the engine starts. This particularly important when starting the machine from cold.

⚠️ Do not run the starter motor for too long. If the engine does not start immediately, wait a minute or so before trying again.

Starting gas is not to be used.

Let the engine idle for a few minutes to warm, longer if the ambient temperature is below +10°C (50°F).

⚠️ Ensure that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

While the engine is warming up, check that the warning lamps for oil pressure (6) and charging (7) are turned off.

The warning lamp for the parking brake (5) should remain on.

⚠️ When starting and driving a machine that is cold, remember that the hydraulic fluid is also cold and that braking distances can be longer than normal until the machine reaches the working temperature.
Operation - Driving

Operating the roller

Under no circumstances is the machine to be operated from the ground. The operator must be seated inside the machine during all operation.

Set the engine speed control (3) to the operating position.

Check that the steering is working correctly by turning the steering wheel once to the right and once to the left while the roller is stationary.

When compacting asphalt, remember to turn on the sprinkler system (2). Use AUT to save water.

Make sure that the area in front of and behind the roller is clear.

Pull up the emergency/parking brake knob (1) and check that the parking brake warning lamp is off. Be prepared that the roller may begin to roll, if it is on a slope.

Carefully move the forward/reverse lever (24) forwards or backwards, depending on which direction of travel is required.

Speed increases as the lever is moved away from the neutral position.

The speed should always be controlled using the forward/reverse lever and never by changing the engine speed.

Test the reserve brake function by depressing the reserve/parking brake knob (1) while the roller is moving forwards slowly.
The forward/reverse lever must then be returned to neutral before continuing driving.

While driving, check that the gauges display normal values and that the warning lamps are not lit. In the event of abnormal values or if the buzzer sounds, immediately stop the roller and the diesel engine. Check and remedy any fault; see also the chapter on maintenance and the engine manual.
Operation - Vibration

Vibration

Manual/Automatic vibration

Manual or automatic vibration activation/deactivation is selected using switch (20).

In manual mode, the operator must activate vibration via the switch (4) on the forward/reverse lever (6).

In the automatic position, vibration is activated when the pre-set speed is reached. Vibration is automatically deactivated when the lowest pre-set speed is reached.

Switching on vibration is controlled by two microswitches, each actuated by its own cam on the shaft for the forward/reverse lever. The position for switching on and hence the speed are adjustable.

Cams close to each other: Vibration engaged at low speed.

Cams apart Vibration engaged at higher speed. Ensure that vibration is engaged at the same speed in forward and reverse.
**Manual vibration - Switching on**

![Warning symbol]

Never activate vibration when the roller is stationary. This can damage both the surface and the machine.

Switch vibration on and off using the switch (38) on the forward/reverse lever.

Always switch off vibration before the roller comes to a standstill.

The engine does not stop if the parking brake is activated.

**Amplitude/frequency - Changeover**

There are two drum vibration settings. Use the switch (24) to adjust.

Turn the knob to the left for low amplitude/high frequency and to the right for high amplitude/low frequency.

![Warning symbol]

Setting the amplitude may not be performed when vibration is in operation. Switch the vibration off first and wait until vibration stops before setting amplitude.
Operating - Stopping

Braking

Emergency brake

Braking is normally activated using the forward/reverse lever. The hydrostatic transmission retards and slows the roller when the lever is moved towards the neutral position.

In addition, a disc brake in each drum motor acts as reserve brake when driving, and as a parking brake when stationary.

To brake, press the reserve/parking brake knob (3), hold the steering wheel firmly and be prepared for a sudden stop.

After braking, return the forward/reverse lever to the neutral position and pull up the emergency/parking brake knob up.

Switching off

Turn the engine speed selector back to idling, allow the engine to idle a few minutes to cool down.

Check instruments and warning lamps to see if any faults are indicated. Switch off all lights and other electrical functions.

Push in the emergency/parking brake knob(15).

Turn the starter switch (7) to mode 0. Lower the instrument cover and lock it.
Parking

Chocking the drums

Never disembark from the machine when the engine is running, unless the emergency/parking brake knob is depressed.

Make sure that the roller is parked in a safe place with respect to other road users. Chock the drums if the roller is parked on sloping ground.

Keep in mind that there is a risk of freezing during the winter. Check the anti-freeze in the diesel engine and the screenwash bottle in the cab. Drain the water tanks, sprinkler pumps and water lines.

Master switch

Before leaving the roller for the day, switch the battery master switch (1) to the disconnected position and remove the key knob.

This will prevent battery discharging and will also make it difficult for unauthorized persons to start and operate the machine.
Long-term parking

The following instructions should be followed when long term parking (more than one month).

These measures apply when parking for a period of up to 6 months.

Before re-commissioning the roller, the points marked with an asterisk * must be returned to the pre-storage state.

Wash the machine and touch up the paint finish to avoid rusting.

Treat exposed parts with anti-rust agent, lubricate the machine thoroughly and apply grease to unpainted surfaces.

**Engine**

* Refer to the manufacturer’s instructions in the engine manual that is supplied with the roller.

**Battery**

* Remove the battery from the machine. Clean the battery, check that the electrolyte level is correct (see under the heading 'Every 50 hours of operation') and trickle-charge the battery once a month.

**Air cleaner, exhaust pipe**

* Cover the air cleaner (see under the heading 'Every 50 hours of operation' or 'Every 1000 hours of operation') or its opening with plastic or tape. Also cover the exhaust pipe opening. This is to avoid moisture entering the engine.

**Sprinkler system**

* Drain the water tank completely (see under the heading ‘Every 2000 hours of operation’). Drain all hoses, filter housings and the water pump. Remove all sprinkler nozzles (see under the heading ‘Every 10 hours of operation’).

**Fuel tank**

Fill the fuel tank completely full to prevent condensation.
Long-term parking

Hydraulic reservoir

Fill the hydraulic reservoir to the uppermost level mark (see under the heading 'Every 10 hours of operation'.)

Steering cylinder, hinges, etc.

Lubricate the steering joint bearings and both bearings on the steering cylinder with grease (see under the heading 'Every 50 hours of operation').

Grease the steering cylinder piston with conservation grease.

Grease the hinges on the doors to the engine compartment and the cab. Grease both ends of the forward/reverse control (bright parts) (see under the heading 'Every 500 hours of operation').

Hoods, tarpaulin

* Lower the instrument cover over the instrument panel.

* Cover the entire roller with a tarpaulin. A gap must be left between the tarpaulin and the ground.

* If possible, store the roller indoors and ideally in a building where the temperature is constant.
Lifting

Locking the articulation

⚠️ Articulation must be locked to prevent inadvertent turning before lifting the roller.

Turn the steering wheel to the straight ahead position. Push in the emergency/parking brake knob.

Pull out the lowermost locking pin, which has a wire attached. Pull up the locking dowel (2), which also has a wire attached.

Fold out the locking arm (3) and position it over the locking lug on the rear machine frame.

Fit the locking dowel in the holes through the locking arm and locking lug and secure the dowel in position with the locking pin.

Lifting the roller

⚠️ The machine’s gross weight is specified on the hoisting plate (1). Refer also to the Technical specifications.

⚠️ Lifting gear such as chains, steel wires, straps, and lifting hooks must conform with current regulations.

⚠️ Stand well clear of the hoisted machine! Make sure that the lifting hooks are properly secured.
Unlocking the articulation

- Remember to unlock the articulation before operating.

Fold the locking arm (3) back and secure it in the locking lug (4) with the locking dowel (2). The locking lug (4) is located on the tractor frame.

Towing

The roller can be moved up to 300 meters (1,000 ft) using the instructions below.

Short distance towing with the engine running

- Depress the emergency/parking brake knob and temporarily shut off the engine. Chock the drums to prevent the machine from rolling.

Open the right door to the engine compartment to access the propulsion pump.

Turn both towing valves (1) (middle hexagonal nuts) three turns counter clockwise, while holding the multifunction valve (2) (lowermost hexagonal nuts) in place. The valves are located on the upper side of the propulsion pump.

Start the engine and allow it to idle.

The roller can now be towed and can also be steered if the steering system is otherwise functioning.
Towing short distances when the engine is inoperative

- Chock the drums to prevent the roller moving when the brakes are mechanically disengaged.

Set a steel bar in the pump lever (2) and pump by moving the bar up and down until the brakes release or until a certain amount of hydraulic resistance can be felt.

The brakes are now disengaged and the roller can be towed at LOW speed.

- After towing. Pull the lever (1) to activate the brake.

- Always lock the pump with a padlock when it is not in use.
Towing the roller

When towing/recovering, the roller must be braked by the towing vehicle. A towing bar must be used as the roller has no brakes.

The roller must be towed slowly, max. 3 km/h (2 mph) and only towed short distances, max. 300 m (330 yards).

When towing/retrieving a machine, the towing device must be connected to both lifting holes. The pulling force must act longitudinally on the machine as shown in the figure. Maximum gross pulling force 265 kN (59575 lbf).

Reverse the towing preparations.

Roller prepared for transport

Lock the articulation before lifting and transporting. Follow the instructions under the relevant heading.

Chock the drums (1) and secure the chocks to the transport vehicle.

Block up under the drum frame (2), to avoid overload on the rubber suspension of the drum when lashing.

Clamp down the roller with lashing strap (3) at all four corners; decals indicate the fixing points.

Remember to return the articulation to its unlocked position before starting the roller.
Operating instructions - Summary

1. Follow the SAFETY INSTRUCTIONS specified in the Safety Manual.

2. Make sure that all instructions in the MAINTENANCE section are followed.

3. Turn the master switch to the ON position.

4. Move the forward/reverse lever to the NEUTRAL position.

5. Set the vibration switch for Manual/Automatic in position 0.

6. Set the engine speed control to idle.

7. Start the engine and allow it to warm up.

8. Set the engine speed control to the operating position.

9. Set the reserve/parking brake knob in the pulled-out position.

10. Operate the roller. Handle the forward/reverse lever with care.

11. Check the brakes. Remember that the braking distance will be longer if the roller is cold.

12. Use vibration only when the roller is in motion.

13. Check that the drums are thoroughly watered when watering is required.

14. IN AN EMERGENCY:
   - Push in the EMERGENCY/PARKING BRAKE KNOB
   - Hold the steering wheel firmly.
   - Brace yourself for a sudden stop.

15. When parking:
    - Push in the emergency/parking brake knob.
    - Stop the engine and chock the drums.

16. When lifting: - Refer to the relevant section in the Instruction Manual.

17. When towing: - Refer to the relevant section in the Instruction Manual.

18. When transporting: - Refer to the relevant section in the Instruction Manual.

19. When recovering - Refer to the relevant section in the Instruction Manual.
Preventive maintenance

Complete maintenance is necessary for the machine to function satisfactorily and at the lowest possible cost.

The Maintenance section includes the periodic maintenance that must be carried out on the machine.

The recommended maintenance intervals assume that the machine is used in a normal environment and working conditions.

Acceptance and delivery inspection

The machine is tested and adjusted before it leaves the factory.

On arrival, before delivery to the customer, delivery inspection must be conducted as per the check list in the warranty document.

Any transport damage must be immediately reported to the transport company.

Warranty

The warranty is only valid if the stipulated delivery inspection and the separate service inspection have been completed as per the warranty document, and when the machine has been registered for starting under the warranty.

The warranty is not valid if damage has been caused by inadequate service, incorrect use of the machine, the use of lubricants and hydraulic fluids other than those specified in the manual, or if any other adjustments have been made without the requisite authorisation.
Always use high-quality lubricants and the amounts recommended. Too much grease or oil can cause overheating, resulting in rapid wear.

General

Periodic maintenance should be carried out after the number of hours specified. Use the daily, weekly etc. periods where number of hours cannot be used.

Remove all dirt before filling, when checking oils and fuel and when lubricating using oil or grease.

The manufacturer's instructions found in the engine manual also apply.

Every 10 hours of operation (Daily)

Maintenance - 10h

Park the roller on a level surface. When checking and making adjustments, the engine should be switched off and the emergency/parking brake should be applied, if not otherwise specified.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Diesel engine  Check oil level

Take care not to touch any hot parts of the engine or the radiator when removing the dipstick. Risk for burns.

The dipstick is located on the engine’s right side.
Pull up the dipstick (1) and check that the oil level is between the upper and lower marks. For further details, refer to the engine’s instruction manual.

Fig. Engine compartment
1. Dipstick
**Coolant level - Check**

Check that level of the coolant is between the max. and min. marks.

*Take great caution if the radiator cap must be opened while the engine is hot. Wear protective gloves and goggles.*

Fill with a mixture of 50% water and 50% anti freeze. See the lubrication specification in these instructions and in the engine manual.

*Flush the system every other year and change the coolant. Make sure also that the air flow through the cooler is unobstructed.*

**Water separator - Drainage**

Place a receptacle below the drainage tap located at the bottom of the fuel filter. Open the tap and collect the water and contaminants in the receptacle. Allow it to run until pure fuel comes out. Close the drainage tap.

*Dispose of the collected fluid in an approved manner.*
Brakes - Check

Check the brakes by carrying out the following:

1. Slowly drive the roller forwards.
2. Depress the reserve/parking brake knob (1), the brake warning lamp (3) on the instrument panel should come on and the roller should stop.
3. After testing the brakes, set the forward/reverse lever (2) in neutral.
4. Pull up the emergency/parking brake knob.
5. The roller is now ready for operation.

Sprinkler system - Check, cleaning

1. Close the stop cock (1) and remove the housing from water filter (2) in order to clean the strainer and housing.
Nozzle - Dismantling/Cleaning

Dismantle the blocked nozzle by hand.

Blow the nozzle (2) and fine filter (4) clean using compressed air. Alternatively, fit replacement parts and clean the blocked parts at a later point in time.

After inspecting and carrying out any necessary cleaning, start the system and check that it works.

⚠️ Wear protective goggles when working with compressed air.

Scrapers - Check, adjustment

Adjust the scrapers so that a gap of 1-2 mm is obtained across the entire drum width.

Loosen the screws (1).

Move the scraper (2) to the correct position, 1-2 mm from the drum (3).

Replace the scraper with a new one if it is so worn that the required gap cannot be achieved.

Tighten the screws and the nuts.
Hydraulic reservoir, Level check - Filling

Place the roller on a level surface and check the fluid level in the sight glass (1).

Top up with new hydraulic fluid if the level is more than 19 mm from the upper edge of the sight glass.

Clean around the filler cap (5) before the cap is removed. Check that the strainer in the filler pipe is intact.

Fill with fresh hydraulic fluid of the grade indicated in the Lubricant specification.

Water tanks - Filling

Unscrew the tank cap, check that the strainer (1) is intact. If necessary life out the strainer for cleaning. Use clean water when filling.

Only additive: A small amount of environmentally friendly antifreeze.
Fuel tank - Filling

Refuel daily with diesel fuel up to the lower edge of the filler pipe (1). Follow the engine manufacturer's specification with regard to the quality of diesel fuel.

⚠️ **Stop the diesel engine. Short-circuit (press) the filler gun against a non-insulated part of the roller before refueling, and against the filler pipe (2) while refueling.**

⚠️ **Never refuel while the engine is running. Do not smoke and avoid spilling fuel.**
Park the roller on a level surface. When checking and making adjustments, the engine should be switched off and the emergency/parking brake should be applied, if not otherwise specified.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Air cleaner
Checking - Cleaning

Replace or clean the air cleaner main filter if the warning lamp on the control panel comes on when the engine is running at maximum speed.

Release the three locking catches (1), pull off the cover (2), and pull out the main filter (3).

Do not remove the backup filter (4).
Main filter
- Cleaning with compressed air

When cleaning the air filter, use compressed air with a maximum pressure of 5 bars. Blow air up and down along the paper pleats on the inside of the filter.

Hold the nozzle at least 2-3 cm (0.8-1.2 in) away from the paper pleats so that the paper is not torn by the air pressure.

⚠️ Wear protective goggles when working with compressed air.

Wipe the inside of the cover (2) and the filter housing (5) clean. See the previous illustration.

⚠️ Check that the hose clamps between the filter housing and the suction hose are tight and that the hoses are intact. Inspect the entire hose system, all the way to the engine.

⚠️ Change the main filter after 5 cleanings or more frequently.

Backup filter - Change

Change the backup filter with a new filter after every fifth replacement or cleaning of the main filter.

The safety filter must not be cleaned.

To change the backup filter (1), pull the old filter out of its holder, insert a new filter and reassemble the air cleaner in the reverse order.
Rubber elements and fastening screws - Check

Check all rubber elements (1), replace all of the elements if more than 20% of them on one side of the drum are cracked deeper than 10-15 mm (0.4-0.6 in).

Check using a knife blade or pointed object.

Check also that the screws/nuts (2) are tightened.

![The rubber elements' screws in the drum are locked with Loctite. Check the rubber elements on both sides of the drum.]

Articulation and steering cylinder - Lubrication

Nobody must be allowed near the steering joint when the engine is running. Risk of being crushed when the steering is operated. Switch off the engine and press the reserve/parking brake knob before lubricating.

Wipe the grease nipples clean. Lubricate the articulation nipples (1) with five strokes of the hand grease gun, and the steering cylinder bearings (2) with two strokes in each bearing. Make sure that grease penetrates into the bearings. If grease does not penetrate, it may be necessary to relieve the pressure on the articulation joint with a jack and then repeat the greasing process.
Hydraulic reservoir - Check/venting

Unscrew and make sure that the reservoir cap’s ventilation hole (1) is not clogged, air must have unobstructed passage through the cap in both directions.

If blocked in either direction, clean with a little diesel oil and blow with compressed air until unblocked or replace the cap with a new one.

Wear protective goggles when working with compressed air.

Battery
Checking the electrolyte level

Make sure there is no open flame in the vicinity when checking the electrolyte level. Explosive gas is formed when the alternator charges the battery.

Open the left door of the engine compartment. Turn both quick-fit screws on the plate over the battery 1/4 turn counter-clockwise and fold out the plate.

Wear safety goggles. The battery contains acid, which is corrosive. In the event of contact with the acid, rinse with water.

When disconnecting the battery, always disconnect the negative cable first. When connecting the battery, always connect the positive cable first.

The cable shoes should be clean and tightened. Corroded cable shoes should be cleaned and greased with acid-proof Vaseline.

Wipe the top of the battery.
Battery cell

Take off the cell caps (1) and make sure that electrolyte (2) is about 10 mm (0.4 in) above the plates (3). Check the level of all cells. Top off with distilled water to the right level if the level is low.

If the ambient temperature is below freezing, run the engine for a while before topping off with distilled water. Otherwise the electrolyte might freeze.

Make sure that ventilation holes in the cell cover are not clogged, then put the cover back on.

The cable shoes should be clean and well tightened. Clean corroded cable shoes and grease them with acid-free Vaseline.

Always disconnect the negative cable first when disconnecting the battery. When connecting the battery, always connect the positive cable first.

Discard used batteries wisely. Batteries contain lead, which is harmful to the environment.

Before doing any electric welding on the machine, disconnect the battery ground cable and then all electrical connections to the alternator.
Maintenance - 250h

Park the roller on a level surface. When checking and making adjustments, the engine should be switched off and the emergency/parking brake should be applied, if not otherwise specified.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Pump drive - Oil level, Check - Filling

Position the roller on a level surface. When checking the oil level, switch the engine off and ensure that the parking brake is applied.

Open the right door of the engine compartment and unscrew the dipstick (1).

The oil level should be between the two marks on the lower edge of the dipstick.

Fill with transmission oil if required, see Lubricant Specification.

Ensure that the rubber gasket between the dipstick and the gear housing is in place, and screw in the dipstick.

Fig. Pump gear
1. Dipstick
Drum drive - Checking the oil level

Place the roller on a level surface so that filler plug (1) is at the top. Wipe around the plugs.

The oil level must reach the level plug (3).

If necessary, remove the filler plug and fill with oil in accordance with the lubricant specification, although not more than up to the level plug.
Maintenance - 500h

Park the roller on a level surface. When checking and making adjustments, the engine should be switched off and the emergency/parking brake should be applied, if not otherwise specified.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Drum - Checking the oil level

Switch off the engine, press the parking brake knob and disconnect the power.

Place the roller on a level surface so that level pin (1) is level with the top of the front frame member. Wipe around the plugs.

The oil level must reach the level plug (3).

If necessary, remove the filler plug (2) and fill with oil in accordance with the oil specification, although not more than up to the level plug.
Controls and moving joints - Lubrication

Lubricate the hinges for the hood, side windows and any cab doors with grease. Also lubricate the slide rails for the operator's seat and the control table's bearing with grease; lubricate other joints and controls with oil. See the lubricant specification.

1. Grease nipple

Fig. Control column
1. Grease nipple
Maintenance - 1000h

Park the roller on a level surface. When checking and making adjustments, the engine should be switched off and the emergency/parking brake should be applied, if not otherwise specified.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Hydraulic fluid filter - Replacement

Clean thoroughly around the fluid filter.

Remove the fluid filters (1) and dispose of them in an approved manner. They are single-use filters and cannot be cleaned.

Make sure that the old sealing rings are not left on the filter holders, as this could cause leakage between the new and old gaskets.

Thoroughly clean the sealing surfaces of the filter holders.

Apply a thin coat of fresh hydraulic fluid to the rubber seals on the new filters. Screw the filters tight by hand.

First tighten the filter until its seal is in contact with the filter attachment. Then turn an additional half revolution. Do not tighten the filter too hard as this could damage the gasket.

Start the engine and check that there is no leakage of hydraulic fluid from the filters. Check level of fluid in the sight glass (3) and top up as required.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.
Air filter - Changing

Replace the air cleaner main filter (1) even if it has not been cleaned five times. See under the heading 'Every 50 hours of operation' for information on changing the filter.

⚠️ If a blocked filter is not replaced, the exhaust fumes will be black and the engine will lose power. There is also a risk of severe damage to the engine.

Fuel tank - Drainage

Water and sediment in the fuel tank are removed via the drain plug (1) in the bottom of the fuel tank.

⚠️ Be very careful during draining. Do not drop the plug or else all the fuel will flow out.

Drainage must be performed when the roller has been stationary for an extended period, e.g. after being stationary overnight. The fuel level should be as low as possible.

The roller should preferably have been standing with this side slightly lower, so that water and sediment have gathered near the drain plug (1).

Collect the condensate and sediment and dispose of it in an approved manner.

Drain as follows:

- Place a container under the plug (1).
- Remove the plug (1).
- Drain out the condensate and sediment until only pure fuel emerges at the plug.
- Refit the plug again.
Hydraulic fluid reservoir - Draining

Condensate in the hydraulic reservoir is drained via the plug (1).

Be very careful during draining. Do not drop the plug or else all the hydraulic fluid will flow out.

Drainage must be performed when the roller has been stationary for an extended period, e.g. after being stationary overnight.

Drain as follows:
- Place a container under the plug (1).
- Remove the plug.
- Drain the condensate until pure hydraulic fluid runs out.
- Refit the plug again.

Collect the condensate and accompanying hydraulic fluid and dispose of it in an approved manner.
Maintenance - 2000h

Park the roller on a level surface. When checking and making adjustments, the engine should be switched off and the emergency/parking brake should be applied, if not otherwise specified.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Hydraulic reservoir - Replacing the fluid/filter

Before replacing the fluid, it is important that the roller has been warmed up for a sufficient length of time in order for the fluid to have warmed up and thinned prior to draining. This makes it easier for any contaminants to leave the reservoir with the fluid. Bear cleanliness in mind when working with hydraulic components.

Take great care when draining warm fluids and oils. Wear protective gloves and goggles.

Position the roller on a level surface.

Replace the hydraulic fluid filters and check the tank cap's ventilation, see instruction under 50 h.

Position a collection receptacle for the required amount and drain off the hydraulic fluid.

Fill with hydraulic fluid in accordance with the lubricant specification, until the correct level is achieved in the sight glass.

Start the engine, drive and vibrate with the roller. Stop the engine, check the fluid level and check for leaks. Top up if necessary.

Dispose of the drained fluid for environmentally correct handling.
Drum - Changing the oil

Switch off the engine, press the parking brake knob and disconnect the power.

Collect and dispose of the drained oil for environmentally correct handling.

Applies to both sides of the drum:

After warming up, place the roller on a flat surface so that the plugs (2) are at the bottom. Wipe around the plugs.

Remove the plug (2) on one side and drain the oil, approximately 27 liters, into a suitable receptacle.

Drain the oil in the same way on the other side. Clean the plugs and wait until all the oil has run out. Wipe up any spilled oil.

Drive the roller until the plugs (2) are at the top and the level pin is level with the top of the front frame member.

Fill with oil in accordance with the Lubricant specification until the level reaches the plug (3). Refit the plugs and wipe up any spilled oil.
Drum drive - Changing the oil

Applies to both drums:

![Exclamation Mark]

Before replacing the oil, it is important that the roller has been warmed up for a sufficient length of time in order for the oil to have warmed up and thinned prior to draining. This makes it easier for any contaminants to leave the reservoir with the fluid. Bear cleanliness in mind when working with hydraulic components.

*Take great care when draining warm fluids and oils. Wear protective gloves and goggles.*

Place the roller on a level surface so that drain plug (2) is at the bottom. Wipe around the plugs.

Place a receptacle under the drain plug and drain the oil. The receptacle must hold at least 4 liters.

Remove the filler plug (1) and the level plug (3). Wait until all the oil has run out. Clean any metal residue from the plugs. Refit the drain plug and fill with oil in accordance with the lubricant specification, although not more than up to the level plug. Refit the plugs. Wipe up any spilled oil.
Pump drive - Changing the oil

When the pump drive has reached working temperature: Position the roller on a level surface.

*Switch off the engine, press the parking brake knob and disconnect the power.*

Collect the oil in a container and dispose of for environmentally correct handling.

Wipe around the plugs.

Unscrew the filler plug/dipstick (1) and the drain plug (2). Drain the oil, approx. 4 liters.

Clean and refit the drain plug.

Fill with new transmission oil according to the lubricant specification. Fill slowly so that the oil has time to level out.

Check with the dipstick and do not overfill. Tighten the filler plug/dipstick and wipe up any spilled oil.
