Introduction

The machine

Dynapac CC900S is a self-propelled vibratory tandem roller in the 1.6 metric tonnes class featuring 900 mm wide drums. The machine is equipped with drive, brakes, and vibration on both drums.

Intended use

CC900S is primarily used for smaller compaction works, such as minor roads, sidewalks, cycle ways and minor parking places.

Warning symbols

WARNING ! Marks a danger or a hazardous procedure that can result in life threatening or serious injury if the warning is ignored.

CAUTION ! Marks a danger or hazardous procedure that can result in damage to the machine or property if the warning is ignored.

Safety information

It is recommended to at least train operators in handling and daily maintenance of the machine in accordance with the instruction manual. Passengers are not allowed on the machine, and you must sit in the seat when operating the machine.

The safety manual supplied with the machine must be read by all roller operators. Always follow the safety instructions. Do not remove the manual from the machine.

We recommend that the operator reads the safety instructions in this manual carefully. Always follow the safety instructions. Ensure that this manual is always easily accessible.

Read the entire manual before starting the machine and before carrying out any maintenance.
**Introduction**

- **Ensure good ventilation (extraction of air by fan) where the engine is run indoors.**

- **Replace immediately the instruction manuals if lost, damaged or unreadable.**

- **Prevent persons from entering or remaining in the danger area, i.e. a distance of at least 7 m (23 ft) in all directions from operating machines.** The operator may allow a person to remain in the danger area, but should then observe caution and operate the machine only when the person is visible or has given clear indications of where he or she is.

---

**CALIFORNIA**

**Proposition 65 Warning**

Diesel engine exhaust and some of its constituents are known to the State of California to cause cancer, birth defects, and other reproductive harm.

---

**General**

This manual contains instructions for machine operation and maintenance.

The machine must be correctly maintained for maximal performance.

The machine should be kept clean so that any leakages, loose bolts and loose connections are discovered at as early a point in time as possible.

Inspect the machine every day, before starting. Inspect the entire machine so that any leakages or other faults are detected.

Check the ground under the machine. Leakages are more easily detected on the ground than on the machine itself.

![THINK ENVIRONMENT !](image)

**THINK ENVIRONMENT !** Do not release oil, fuel and other environmentally hazardous substances into the environment. Always send used filters, drain oil and fuel remnants to environmentally correct disposal.

This manual contains instructions for periodic
maintenance normally carried out by the operator.

The machine illustrated in this manual can be equipped with optional equipment.

⚠ Additional instructions for the engine can be found in the manufacturer’s engine manual.

CE marking and Declaration of conformity
(Applies to machines marketed in EU/EEC)

This machine is CE marked. This shows that on delivery it complies with the basic health and safety directives applicable for the machine in accordance with machinery directive 2006/42/EC and that it also complies with other directives applicable for this machine.

A "Declaration of conformity" is supplied with this machine, which specifies the applicable directives and supplements, as well as the harmonized standards and other regulations that are applied.
Safety - General instructions

(Also read the safety manual)

1. The operator must be familiar with the contents of the OPERATION section before starting the roller.

2. Ensure that all instructions in the MAINTENANCE section are followed.

3. Only trained and/or experienced operators are to operate the roller. Passengers are not permitted on the roller. Remain seated at all times when operating the roller.

4. Never use the roller if it is in need of adjustment or repair.

5. Only mount and dismount the roller when it is stationary. Use the intended grips and rails. Always use the three-point grip (both feet and one hand, or one foot and both hands) when mounting or dismounting the machine. Never jump down from the machine.

6. The ROPS (Roll Over Protective Structure) should always be used when the machine is operated on unsafe ground.

7. Drive slowly in sharp bends.

8. Avoid driving across slopes. Drive straight up or straight down the slope.

9. When driving close to edges, ditches or holes, make sure that at least 2/3 of the drum width is on previously compacted material (solid surface).

10. Make sure that there are no obstacles in the direction of travel, on the ground, in front of or behind the roller, or overhead.

11. Drive particularly carefully on uneven ground.

12. Use the safety equipment provided. The seat belt must be worn on machines fitted with ROPS.

13. Keep the roller clean. Clean any dirt or grease that accumulates on the operator platform immediately. Keep all signs and decals clean and legible.

14. Safety measures before refueling:
   - Shut off the engine
   - Do not smoke
   - No naked flame in the vicinity of the machine
   - Ground the filling device nozzle to the tank to avoid sparks

15. Before repairs or service:
   - Chock the drums/wheels and under the strike-off blade.
   - Lock the articulation if necessary
16. Hearing protection is recommended if the noise level exceeds 85 dB(A). The noise level can vary depending on the equipment on the machine and the surface the machine is being used on.

17. Do not make any changes or modifications to the roller that could affect safety. Changes are only to be made after written approval has been given by Dynapac.

18. Avoid using the roller before the hydraulic fluid has reached its normal working temperature. Braking distances can be longer than normal when the fluid is cold. See instructions in the STOP section.

19. For your own protection always wear:
- helmet
- working boots with steel toecaps
- ear protectors
- reflecting clothing/high visibility jacket
- working gloves
Safety - when operating

Prevent persons from entering or remaining in the danger area, i.e. a distance of at least 7 m (23 ft) in all directions from operating machines. The operator may allow a person to remain in the danger area, but should then observe caution and operate the machine only when the person is visible or has given clear indications of where he or she is.

Slopes

This angle has been measured on a hard, flat surface with the machine stationary.

The steering angle was zero, the vibration was switched off and all tanks were full.

Always take into consideration that loose ground, steering the machine, vibration on, machine speed across the ground and raising the center of gravity can all cause the machine to topple at smaller slope angles than those specified here.

It is recommended that the ROPS (Roll Over Protective Structure) is always used when driving on slopes or unsafe ground.

Where possible, avoid driving across slopes. Drive instead straight up and down sloping ground.
Driving near edges

When driving near an edge, minimum 2/3 of the drum width must be on solid ground.

Keep in mind that the machine’s center of gravity moves outwards when steering. For example, the center of gravity moves to the right when you steer to the left.

Fig. Position of drum when driving near an edge
Sitting position

Remain seated at all times when operating the roller. If the operator stands up during operation, a buzzer sounds. After 4 seconds the brakes are activated and the engine stops. Brace yourself for a sudden stop.

⚠️ Always use the seat belt where fitted. Where the seat belt is not used, there is a great risk that the operator will be thrown off and land under the machine if the machine topples over.

The seat belt is standard equipment on rollers fitted with Roll Over Protective Structure (ROPS) (1).

⚠️ ROPS should always be in the raised position when machines with foldable ROPS are operated.
Special instructions

Standard lubricants and other recommended oils and fluids

Before leaving the factory, the systems and components are filled with the oils and fluids specified in the lubricant specification. These are suitable for ambient temperatures in the range -15°C to +40°C (5°F - 104°F).

⚠️ The maximum temperature for biological hydraulic fluid is +35°C (95°F).

Higher ambient temperatures, above +40°C (104°F)

For operation of the machine at higher ambient temperatures, however maximum +50°C (122°F), the following recommendations apply:

The diesel engine can be run at this temperature using normal oil. However, the following fluids must be used for other components:

Hydraulic system - mineral oil Shell Tellus T100 or similar.

Lower ambient temperature - Freeze risk

Make sure that the watering system is empty/drained of water (sprinkler, hoses, tank/s) or that anti-freeze has been added, to prevent the system freezing.

Temperatures

The temperature limits apply to standard versions of rollers.

Rollers equipped with additional equipment, such as noise suppression, may need to be more carefully monitored in the higher temperature ranges.

High pressure cleaning

Do not spray water directly onto electrical components or the instrument panels.

Place a plastic bag over the fuel filler cap and secure with a rubber band. This is to avoid high pressure water entering the vent hole in the filler cap. This could cause malfunctions, such as the blocking of filters.

⚠️ Never aim the water jet directly at the fuel tank cap. This is particularly important when using a high-pressure cleaner.
Special instructions

Fire fighting
If the machine catches fire, use an ABE-class powder fire extinguisher.

A BE-class carbon dioxide fire extinguisher can also be used.

Roll Over Protective Structure (ROPS), ROPS approved cab

If the machine is fitted with a Roll Over Protective Structure (ROPS, or ROPS approved cab) never carry out any welding or drilling in the structure or cab.

Never attempt to repair a damaged ROPS structure or cab. These must be replaced with new ROPS structure or cabs.

Battery handling

When removing batteries, always disconnect the negative cable first.

When fitting batteries, always connect the positive cable first.

Dispose of old batteries in an environmentally friendly way. Batteries contain toxic lead.

Do not use a quick-charger for charging the battery. This may shorten battery life.
Jump starting

\[ \textbf{Do not connect the negative cable to the negative terminal on the dead battery. A spark can ignite the oxy-hydrogen gas formed around the battery.} \]

\[ \textbf{Check that the battery used for jump starting has the same voltage as the dead battery.} \]

Turn the ignition and all power consuming equipment off. Switch off the engine on the machine which is providing jump start power.

First connect the jump start battery's positive terminal (1) to the flat battery's positive terminal (2). Then connect the jump start battery's negative terminal (3) to, for example, a bolt (4) or the lifting eye on the machine with the flat battery.

Start the engine on the power providing machine. Let it run for a while. Now try to start the other machine. Disconnect the cables in the reverse order.
Technical specifications

Vibrations - Operator station
(ISO 2631)

<table>
<thead>
<tr>
<th>The vibration levels are measured in accordance with the operational cycle described in EU directive 2000/14/EC on machines equipped for the EU market, with vibration switched on, on soft polymer material and with the operator’s seat in the transport position.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measured whole-body vibrations are below the action value of 0.5 m/s² as specified in Directive 2002/44/EC. (Limit is 1.15 m/s²)</td>
</tr>
<tr>
<td>Measured hand/arm vibrations also were below the action level of 2.5 m/s² specified in the same directive. (Limit is 5 m/s²)</td>
</tr>
</tbody>
</table>

Noise level

<table>
<thead>
<tr>
<th>The noise level is measured in accordance with the operational cycle described in EU directive 2000/14/EC on machines equipped for the EU market, on soft polymer material with vibration switched on and the operator's seat in the transport position.</th>

Machine description

Identification

Product identification number on the frame

The machine PIN (Product Identification Number) (1) is punched on the right edge of the front frame.

Fig. PIN right side

Fig. PIN front right
Machine plate

The machine plate (1) is attached to the front right side of the rear frame, beside the steering joint.

The plate specifies the manufacturer's name and address, the type of machine, the PIN, Product Identification Number (serial number), operating weight, engine power and year of manufacture. CE markings and the year of manufacture may be omitted on machines supplied to markets outside the EU.

Please state the machine's PIN when ordering spares.

**Explanation of 17PIN serial number**

Engine plates

The plates specify the type of engine, serial number and the engine specification.

The engine type plate (2) is attached to the top of the engine.

Please specify the engine serial number when ordering spares. Refer also to the engine manual.

| 3. K9 Direction indicators |
| 4. K10 Brake lights |
Operation

Before starting

Battery isolation switch - On - Optional

Remember to carry out daily maintenance. Refer to the maintenance instructions.

The battery isolation switch is located in the engine compartment. Turn the key (1) to the on position. The entire roller is now supplied with power.

The engine cover must be unlocked when operating, so that the battery can be quickly disconnected if necessary.

Driver seat (Std.) - Adjustment

Adjust the operator’s seat so that the position is comfortable and so that the controls are within easy reach.

The seat can be adjusted lengthways (1).
Driver seat (Option)- Adjustment

Adjust the operator’s seat so that the position is comfortable and so that the controls are within easy reach.

The seat can be adjusted as follows.

- Length adjustment (1)
- Weight adjustment (2)
- Back support angle (3)

⚠️ Always make sure that the seat is secure before beginning operation.

⚠️ Do not forget to use the seat belt (4).

Instruments and lamps - Checking

⚠️ Make sure that the emergency stop button is pulled out and the parking brake is activated. When the forward/reverse lever is in neutral, the automatic brake function is engaged.

Turn the switch (1) to position 3a.

Check that the warning lamps in the warning panel (22) come on.

Set the sprinkler switch (12) to the operating position and check that the system is functioning.
Interlock

The roller is equipped with Interlock.

The engine switches off 4 seconds after the operator rises from the seat.

The engine stops whether the forward/reverse lever is in the neutral or the drive position.

The engine does not stop if the parking brake is activated.

⚠️ Sit down for all operations!

Operator position

⚠️ Replace the seat belt (1) if it shows signs of wear or has been subjected to high levels of force.

Never use the forward/reverse levers as a handle when mounting or disembarking from the roller.

Check that the rubber elements (4) on the platform are intact. Worn elements will reduce comfort.

Ensure that the anti-slip (5) on the platform is in good condition. Replace where anti-slip friction is poor.

Machines with folding ROPS must always be operated with the ROPS raised and locked in position.

The interlock must always be checked before operating. To do this the operator stands up from the seat as shown in the instructions in the section Operation.

If ROPS (Roll Over Protective Structure) is fitted to the
roller, always wear the seat belt (1) provided and wear a protective helmet.

Starting

Starting the engine

The operator must remain seated when starting.

Make sure that the emergency stop button (3) is pulled out and the parking brake (31) is activated.

Set the forward/reverse lever (6) in neutral. The engine can only be started when the lever is in neutral.

Set the vibration switch (20) for manual/automatic vibration in (position O).

Do not run the starter motor for too long. If the engine does not start, wait a minute or so before trying again.

At high ambient temperatures, set the speed control (2) to the position just over idling.

Set the speed control to full speed when starting a cold engine. Preheating: Turn key to position II. When the glow lamp (29) goes off: Turn the starter switch (1) to the right. As soon as the engine starts, release the starter switch and reduce the engine speed to just over idling (because high revs can damage a cold engine). As soon as the engine is running smoothly, reduce the revs down to idling.

Warm up the engine at idling speed for a few minutes, although longer if ambient temperature is below +10°C (50°F).
Check while warming the engine that the warning lamps for the oil pressure (24) and charging (28) go out.

The warning lamp (25) should remain on.

When starting and driving a machine that is cold, remember that the hydraulic fluid is also cold and that braking distances can be longer than normal until the machine reaches the working temperature.

Ensure that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.
Driving

Operating the roller

⚠️ Under no circumstances is the machine to be operated from the ground. The operator must be seated inside the machine during all operation.

⚠️ Make sure that the area in front of and behind the roller is clear.

Release the parking brake (31) and check that the parking brake lamp (25) goes off.

Turn the engine speed control upwards (2) and lock it in the working position.

Check that the steering is working correctly by turning the steering wheel once to the right and once to the left while the roller is stationary.

When compacting asphalt, remember to turn on the sprinkler system (12).

Carefully move the forward/reverse lever (6) forwards or backwards, depending on which direction of travel is required.

Speed increases as the lever is moved away from the neutral position.

⚠️ The speed should always be controlled using the forward/reverse lever and never by changing the engine speed.

Check when operating that the warning lamps do not come on.
Interlock/Emergency stop/Parking brake - Check

The interlock, emergency stop and parking brake must be checked daily before operating. A function check of the interlock and emergency stop requires a restart.

The interlock function is checked by the operator standing up from the seat when the roller is moving very slowly forwards/backwards. (Check in both directions). Hold the steering wheel firmly and brace yourself for a sudden stop. A buzzer goes on and after 4 seconds the engine switches off and the brakes are activated.

Check the function of the emergency stop by pressing the emergency stop button when the roller is moving slowly forwards/backwards. (Check in both directions). Hold the steering wheel firmly and brace yourself for a sudden stop. The engine switches off and the brakes are activated.

Check the function of the parking brake by activating the parking brake when the roller is moving very slowly forwards/backwards. (Check in both directions). Hold the steering wheel and brace yourself for a sudden stop when the brakes are activated. The engine does not switch off.

Vibration

Manual/Automatic vibration

Manual or automatic vibration activation/deactivation is selected using switch (20).

In the manual position, the operator must activate the vibration using the switch(4) on underside of the forward/reverse lever grip.

In the automatic position, vibration is activated when the pre-set speed is reached. Vibration is automatically deactivated when the lowest pre-set speed is reached.
Manual vibration - Switching on

![Warning]

Vibration should not be active when the roller is stationary. This can damage both the surface and the machine.

Engage and disengage vibration using the switch (4) on the underside of the forward/reverse lever.

Always switch off vibration before the roller comes to a standstill.

Braking

Normal braking

Braking is normally activated using the forward/reverse lever. The hydrostatic transmission brakes the roller when the lever is moved towards the neutral position.

Press the switch (4) to switch off the vibration.

Move the forward/reverse lever (6) to the neutral position to stop the roller.

![Warning]

When starting and driving a machine that is cold, remember that the hydraulic fluid is also cold and that braking distances can be longer than normal until the machine reaches the working temperature.

![Warning]

Never leave the operator platform without activating the parking brake (31).
Emergency braking

There is a brake in each drum motor that acts as an emergency brake during operation.

*To brake in an emergency situation, push in the emergency stop knob (3), hold the steering wheel firmly and be prepared for a sudden stop. The diesel engine stops.*

After braking, return the forward/reverse lever to the neutral position and pull out the emergency brake knob. Restart the engine.

Switching off

Turn the engine speed control (2) back to idling. Allow the engine to idle for a few minutes to cool.

Activate the parking brake (31).

Check instruments and warning lamps to see if any faults are indicated. Switch off all lights and other electrical functions.

Turn the starter switch (1) to the left to the switched off position. At the end of the shift, fold over the instrument cover (9) and lock.
Parking

Chocking the drums

Never leave the operator platform without activating the parking brake (31).

Make sure that the roller is parked in a safe place with respect to other road users. Chock the drums if the roller is parked on sloping ground.

Keep in mind that there is a risk of freezing during the winter. Drain the water tanks and water lines.

Master switch - Optional

Before leaving the roller for the day, switch the master switch (1) to the disconnected position and remove the handle.

This will prevent battery discharging and will also make it difficult for unauthorized persons to start and operate the machine. Lock also the engine cover.
Long-term parking

The following instructions should be followed when long term parking (more than one month).

These measures apply when parking for a period of up to 6 months.

Before re-commissioning the roller, the points marked with an asterisk * must be returned to the pre-storage state.

Wash the machine and touch up the paint finish to avoid rusting.

Treat exposed parts with anti-rust agent, lubricate the machine thoroughly and apply grease to unpainted surfaces.

**Engine**

* Refer to the manufacturer’s instructions in the engine manual that is supplied with the roller.

**Battery**

* Remove the battery from the machine, clean, grease the cable connectors (terminals) and trickle charge the battery once a month. The battery is otherwise maintenance free.

**Air cleaner, exhaust pipe**

* Cover the air cleaner (see under the heading ‘Every 50 hours of operation’ or ‘Every 500 hours of operation’) or its inlet with plastic or tape. Also cover the exhaust pipe opening. This is to avoid moisture entering the engine.

**Sprinkler system**

* Drain the water tank completely (see under the heading ‘Every 2000 hours of operation’). Drain all hoses, filter housings and the water pump. Remove all sprinkler nozzles (see under the heading ‘Every 10 hours of operation’).

**Fuel tank**

Fill the fuel tank completely full to prevent condensation.
Hydraulic reservoir

Fill the hydraulic reservoir to the uppermost level mark (see under the heading ‘Every 10 hours of operation’).

Steering cylinder, hinges, etc.

Grease the steering cylinder piston with conservation grease.

Grease the hinges on the doors to the engine compartment. Grease both ends of the forward/reverse control (bright parts) (see under the heading ‘Every 500 hours of operation’).

Hoods, tarpaulin

* Lower the instrument cover over the instrument panel.

* Cover the entire roller with a tarpaulin. A gap must be left between the tarpaulin and the ground.

* If possible, store the roller indoors and ideally in a building where the temperature is constant.
Lifting

Locking the articulation

Before lifting the roller the steering joint must be locked to prevent it turning.

Turn the steering wheel to the straight ahead position. Switch off the machine. Apply the parking brake.

Pull out the locking pin (1), turn the locking arm (2) to the front frame, secure the locking arm to the front frame half by inserting the locking bolt (3) through the bracket in the front frame and the locking arm.

Secure the position of the locking arm by refitting the locking pin (1).

Lifting the roller

The machine’s gross weight is specified on the hoisting plate (1). Refer also to the Technical specifications.

Lifting gear such as chains, steel wires, straps, and lifting hooks must be dimensioned and used in accordance with the applicable safety regulations for lifting devices.

Stand well clear of the hoisted machine! Make sure that the lifting hooks are properly secured.
Unlocking the articulation

![Warning symbol]

Remember to unlock the articulation before operating.

Pull out the locking pin (1), turn the locking arm (2) for the rear frame, secure the locking arm by inserting the locking bolt (3) through the mounting in the rear frame and locking arm. Insert the locking pin.

Fig. Articulation
1. Locking pin
2. Locking arm
3. Locking bolt
Transport

Roller prepared for transport

**Lock the articulation before lifting and transporting. Follow the instructions under the relevant heading.**

Chock the drums (1) and secure the chocks to the transport vehicle.

Place the wooden wedges (2) between drum and frame to avoid overloading of the roller’s rubber elements when lashing.

Secure the roller with straps (3) at all four corners as shown below to comply with the applicable load safety requirements. The attachment points are shown on the decals.

![Diagram showing arrangement of chocks, wooden wedges, and straps]

**Figure. Arrangement**
1. Chocks
2. Wooden wedges
3. Straps

![Diagram showing securing the machine for loading]

**Figure. Securing the machine for loading**

Remember to return the articulation to its unlocked position before starting the roller.
Towing/Recovering

The roller can be moved up to 300 meters (1,000 ft) using the instructions below.

**Towing the roller**

*Switch off the diesel engine and push in the emergency stop knob. Chock the drum to prevent the roller from moving when the brakes are disengaged.*

![Diagram of the roller](image)

Front drum: Releasing the brake

Loosen the bolts (4) on the hydraulic motor as illustrated below, by screwing each bolt 1/2 turn at a time counter-clockwise. Repeat the sequence until all the bolts feel loose.

![Diagram of the hydraulic motor](image)

**Restored brake**

To reset the brakes, tighten the bolts 1/2 turn/bolt in the correct order, until all the bolts have been tightened.
Rear drum: Releasing the brake

Loosen the bolts (6) on the hydraulic motor as illustrated below, by screwing each bolt 1/2 turn at a time counter-clockwise. Repeat the sequence until all the bolts feel loose.

Restored brake

To reset the brakes, tighten the bolts 1/2 turn/bolt in the correct order, until all the bolts have been tightened.

Towing the roller

A towing bar must be used when towing, as the roller has no brakes and can only be slowed and stopped by the vehicle towing the roller.

The roller must be towed slowly, max. 3 km/h (2 mph) and for short distances only, max. 300 m (1000 ft).

When towing/recovering a machine, the towing device must be connected to both lifting holes. Pulling forces shall act longitudinally on the machine as illustrated. Max total towing force 50.8 kN (11,430 lbf), 25.4 kN (5,715 lbf) per fork.

Reset the steps taken for towing as described in the towing instructions on the previous page.
Operating instructions - Summary

1. Follow the SAFETY INSTRUCTIONS specified in the Safety Manual.

2. Make sure that all instructions in the MAINTENANCE section are followed.

3. Turn the master switch to the ON position.

4. Move the forward/reverse lever to the NEUTRAL position.

5. Set the switch for Manual/Automatic vibration to the 0 position.

6. Set the engine speed control to full speed.

7. Set the emergency stop button in the pulled out position.

8. Start the engine and allow it to warm up.

9. Set the engine speed control to the operating position.

10. Drive the roller. Operate the forward/reverse lever with care.

11. Check the brakes, drive slowly. Remember that the braking distance will be longer if the roller is cold.

12. Use vibration only when the roller is in motion.

13. Check that the drums are thoroughly watered when watering is required.

14. IN AN EMERGENCY:
   - Press the EMERGENCY STOP BUTTON
   - Hold the steering wheel firmly.
   - Brace yourself for a sudden stop. The engine stops.

15. Parking: - Stop the engine and chock the drums.

16. When lifting: - Refer to the relevant section in the Instruction Manual.

17. When towing: - Refer to the relevant section in the Instruction Manual.

18. When transporting: - Refer to the relevant section in the Instruction Manual.

19. When recovering - Refer to the relevant section in the Instruction Manual.
Preventive maintenance

Complete maintenance is necessary for the machine to function satisfactorily and at the lowest possible cost.

The Maintenance section includes the periodic maintenance that must be carried out on the machine.

The recommended maintenance intervals assume that the machine is used in a normal environment and working conditions.

Acceptance and delivery inspection

The machine is tested and adjusted before it leaves the factory.

On arrival, before delivery to the customer, delivery inspection must be conducted as per the check list in the warranty document.

Any transport damage must be immediately reported to the transport company.

Warranty

The warranty is only valid if the stipulated delivery inspection and the separate service inspection have been completed as per the warranty document, and when the machine has been registered for starting under the warranty.

The warranty is not valid if damage has been caused by inadequate service, incorrect use of the machine, the use of lubricants and hydraulic fluids other than those specified in the manual, or if any other adjustments have been made without the requisite authorisation.

Maintenance - Maintenance schedule

General

Periodic maintenance should be carried out after the number of hours specified. Use the daily, weekly etc. periods where number of hours cannot be used.

![Remove all dirt before filling, when checking oils and fuel and when lubricating using oil or grease.]

![The manufacturer's instructions found in the engine manual also apply.]

![Where both operational hours and time intervals are specified, maintenance should be carried out at the point in time that occurs first.]

Every 10 hours of operation (Daily)

Maintenance - 10h

- Park the roller on a level surface. The engine must be switched off and the parking brake activated when checking or adjusting the roller, unless otherwise specified.

- Ensure that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

- Ensure that the engine cover is fully open when work is carried out under the cover.

Diesel engine Check oil level

Open the engine cover lock and lower the engine cover forwards.

Check the oil level using the dipstick (1). The level should be between the marks. If the level is near the lower mark, top off with fresh engine oil via the filler cap (2). See under the heading lubricants for the correct oil grade.

Never overfill with oil, as this can damage the engine.

Fig. Engine
1. Dipstick
2. Filler cap
Check - Coolant system

Check that all hoses/hose connectors are intact and tight. Fill with coolant as specified in the lubricants specification.

⚠️ Take great care when opening the radiator cap while the engine is hot. Wear protective gloves and goggles.

⚠️ Also check the freezing point. Change the coolant every other year.

Hydraulic reservoir, Level check - Filling

Wipe the sight glass (1) clean. Check that the fluid level is between the min. and max. markings. Where required, top off with fresh hydraulic fluid through the filler hose (2).

See under the heading ‘Lubricants’ for the correct fluid grade.
Water tank - Filling

Unscrew the tank cap (1), and fill with clean water.

Fill the water tank; it holds 110 liters.
- Only additive: A small amount of environmentally friendly antifreeze.

Sprinkler system - Check, cleaning

Check that the holes in the sprinkler nozzles (1) are not blocked. Clean where necessary.

Sprinkler system - Check, cleaning

Check that the water filter (1) is not blocked. Clean where necessary. Clean the water filter by unscrewing the filter’s lower section, and clean the strainer and filter housing. Reassemble in the reverse order.
Air circulation - Check

Check that the circulation of air to the engine through the grille in the engine cover is unobstructed.

Scrapers - Check, adjustment

Make sure that the scrapers are undamaged. Adjust the scrapers if necessary in the following way:

For firmer application of the scraper, undo the locking nut (2) and adjust it until the desired application is achieved.

Lock the setting by tightening the lock nut against the mounting bracket (3).

Adjust the pressure on both scraper brackets.

To set a lower scraper pressure, adjust in the reverse order to the above.

Warning lamps - Check

Check that the warning lamps on the control panel function.
Check - Drainage - Water separator

Unscrew the cup (2) and empty.

Deliver the drained fluid to waste handling.

Air cleaner indicator

If the indicator (1) on the air cleaner is red, the air cleaner dust trap (2) must be emptied. The dust trap is emptied by pressing the rubber bellows using the fingers. Also check whether the air hoses are intact.

Clean the air cleaner when operated in extremely dusty environments.
Refueling

Refuel the tank every day before starting work. Open the tank cap and fill through the filler pipe (1).

⚠️ Never refuel while the engine is running. Do not smoke and avoid spilling fuel.

⚠️ Stop the engine. Short circuit the fueling nozzle during refueling by pressing it against the filler pipe (1)

The tank holds 23 liters (6.1 gal) of fuel.

Fig. Left side
1. Filler pipe/cap
Maintenance - 50h

Park the roller on a level surface. The engine must be switched off and the parking brake activated when checking or adjusting the roller, unless otherwise specified.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Ensure that the engine cover is fully open when work is being carried out under it.

After the first 50 hours of operation, the oil filters should be changed.

Brakes - Check

Check operation of the brakes as follows:

Run the roller very slowly forward. Hold the steering wheel firmly and brace yourself for a sudden stop.

Press in the emergency stop button (3). The roller will stop abruptly and the engine will switch off.

After testing the brakes, set the forward/reverse lever in neutral.

Pull out the emergency stop button (3). Start the engine.

The roller is now ready for operation.

Refer also to the section in the manual on operation.
Air cleaner - emptying

Empty the air cleaner dust trap (1) through pressing the rubber bellows using the fingers. Check also that the air hoses are intact.

Clean the air cleaner when operated in extremely dusty environments.

Refer also to the section in the manual on operation.

Rubber elements and fastening screws - Check

Check all the rubber elements (1), and replace all the elements if more than 20% of them on one side of the drum are cracked deeper than 10-15 mm.

Use a the blade of a knife or pointed object to check.

Check also that the screw fasteners (2) are tightened.

⚠️ The screws on the rubber elements are sealed with Loctite. Check the rubber elements on both sides of the roller.
Maintenance - 250h

Park the roller on a level surface. The engine must be switched off and the parking brake activated when checking or adjusting the roller, unless otherwise specified.

Ensure that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Ensure that the engine cover is fully open when work is being carried out under it.

Air cleaner - Cleaning - Change

Clean the air cleaner. Remove the main filter (3) by undoing the catches (1), and then the cover (2).

Check that the filter element is undamaged. Clean the element by banging it against your hand or other soft object.

Then blow clean with compressed air (max 5 bars) from the inside of the filter. Also clean the filter housing (5) and the cover (2).

Replace the filter cartridge after 5 cleanings or more frequently.
Hydraulic fluid cooler - Cleaning

Clean the hydraulic fluid cooler's cooling flanges, ideally with compressed air. Blow the cooler clean by blowing air from the inside outwards.

⚠️ Wear gloves and eye protectors when working with compressed air.

Forward/Reverse controls and joints - Check and lubrication

Remove the plate (1). Check the friction of the forward/reverse controls. The friction screws should be set so that the forward/reverse lever remains in the position in which it is set whilst the machine is operated. The control’s ‘0 position’ is determined by a screw which engages with the groove on the shaft between the controls.

If the control begins to be stiff after a longer period of use, lubricate the controls by the bearings and the control cable with a few drops of oil.

If the forward/reverse lever still is stiff after the above adjustments, lubricate the other end of the control cable with a few drops of oil. The cable is located on the top of the propulsion pump.
Alternator belt - checking tension - Change

Switch off the engine, disconnect the power and switch on the emergency brake button.

If the alternator belt (3) can be pressed in by hand around 10 mm at a position half way between the pulleys, it is correctly tensioned. If the belt needs to be tightened, carry out the following.

Undo the two hexagonal socket screws (1) and (2).

Press the alternator so that the belt is tensioned correctly, as described above.

Tighten first screw (1) and then screw (2). Check that the belt still has the correct tension after tightening.

Replace the alternator belt as required or at the latest at the 1000h service.
Park the roller on a level surface. The engine must be switched off and the parking brake activated when checking or adjusting the roller, unless otherwise specified.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Ensure that the engine cover is fully open when work is being carried out under it

Air cleaner - Cleaning - Change

Clean the air cleaner. Remove the main filter (3) by undoing the catches (1), and then the cover (2).

Check that the filter element is undamaged. Clean the element by banging it against your hand or other soft object.

Then blow clean with compressed air (max 5 bars) from the inside of the filter. Also clean the filter housing (5) and the cover (2).

Replace the filter cartridge after 5 cleanings or more frequently.

Fig. Air cleaner
1. Catches
2. Cover
3. Main filter
4. Backup filter
5. Filter housing
Hydraulic reservoir - Check/venting

Unscrew and make sure that the reservoir cap is not blocked. Air must have unobstructed passage through the cap in both directions.

If blocked in either direction, clean with a little diesel oil and blow with compressed air until unblocked or replace the cap with a new one.

⚠️ Wear eye protectors and gloves when working with compressed air.
Engine oil and oil filter - Change

Run the engine until it is warm before draining the oil.

⚠️ **Switch off the engine and push in the emergency brake button.**

⚠️ **Take great care when draining fluids and oils. Wear protective gloves and goggles.**

Set a container which can hold at least 5 liters (1.3 gal) under the drain plug (2).

Undo the oil filler cap (3), and undo the plug (2) in the end of the drain hose (1). Let all the engine oil flow out.

♻ Deliver the drained oil to special waste handling.

⚠️ Refer to the engine manual for detailed instructions when changing oil and filters.

Remove the oil filter (4) and fit a new filter.

Collect any spillage.

Fit the drain plug (2) to the end of the hose.

Fill with fresh engine oil. See under the heading lubricants, for the correct oil grade. Fit the filler cap (3) and check that the oil level is correct using the dipstick.

Start the engine and allow it to idle for a few minutes. During this time, check around the oil filter for leaks.

Switch off the engine, wait for a minute or so and then check the oil level. Top up with more oil if necessary.
Check - Coolant system

Check that all hoses/hose connectors are intact and tight. Fill with coolant as specified in the lubricants specification.

⚠️ Take great care when opening the radiator cap while the engine is hot. Wear protective gloves and goggles.

Also check the freezing point. Change the coolant every other year.

Drum - Checking the oil level

Rear drum:

Place the roller on a level surface, then operate the roller until the oil plug (1) is directly opposite the semi-circular recess in the drum mounting.

⚠️ Switch off the engine, disconnect the power and switch on the emergency brake button.

Unscrew the plug and check that the oil level reaches the lower edge of the hole. Top up with fresh transmission oil if required. Check under the heading Lubricants to ascertain the correct oil grade.

Clean the magnetic plug (1) of any metallic particles, and refit the plug.
Front drum:

Place the roller on a level surface, then operate the roller slowly until the markings (2-2) are horizontal in relation to each other and the location of the oil plug (1) as illustrated.

**Switch off the engine, disconnect the power and switch on the emergency brake button.**

Unscrew the plug and check that the oil level reaches the lower edge of the hole. If required, top up with fresh transmission oil, up to the lower edge of the hole. Check under the heading Lubricants to ascertain the correct oil grade.

**It is important that the oil level in the drum does not exceed the oil level in the instructions, see picture.**

Clean the magnetic oil plug (1) of any metal residue, and reinstall the plug.
Maintenance - 1000h

Park the roller on a level surface. The engine must be switched off and the parking brake activated when checking or adjusting the roller, unless otherwise specified.

Ensue that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

Ensure that the engine cover is fully open when work is being carried out under it.

Hydraulic fluid filter - Change

Remove the filter (1) and deliver to special waste handling. This is a single-use filter and cannot be cleaned.

Thoroughly clean the filter holder sealing surface.

Apply a thin coat of fresh hydraulic fluid to the rubber gasket on the new filter.

Screw the filter on by hand, firstly until the filter gasket makes contact with the filter base. Then rotate a further ½ turn.

Do not over-tighten. The seal can be damaged.

Start the engine and check that the filter does not leak.
Check the hydraulic oil level in the sight glass (1) and top off where necessary. See under the heading ‘Every 10 hours of operation’.

**Alternator belt - Checking tension - Change**

*Switch off the engine, disconnect the power and switch on the emergency brake button.*

Undo the two hexagonal socket screws (1) and (2). Bend off the old alternator belt and replace with a new one.

Press the alternator across so that the alternator belt is tensioned to the measurement given below.

When the alternator belt (3) can be pressed by hand in around 10 mm halfway between the pulleys, it is correctly tensioned.

Tighten first screw (1) and then screw (2). Check that the belt still has the correct tension after tightening.
Drum - Replace the oil in the front drum

Park the roller on a level surface, and drive the roller slowly until the plug (1) is in the bottom position.

Switch off the engine, disconnect the power and switch on the emergency brake button.

Place a receptacle that will hold at least 1 liter (...gal) under the plug.

Remove the plug (1) and let the oil run out.

Deliver the drained oil to special waste handling.

Top up with new oil in position. 2. See 'Every 500 hours of operation' for filling oil.
Maintenance - 2000h

- Park the roller on a level surface. The engine must be switched off and the parking brake activated when checking or adjusting the roller, unless otherwise specified.

- Ensure that there is good ventilation (air extraction) if the engine is run indoors. Risk of carbon monoxide poisoning.

- Ensure that the engine cover is fully open when work is being carried out under it.

Drum - Replace the oil in the rear drum

- Park the roller on a level surface, and drive the roller slowly until the plug (1) is in the bottom position.
  - Switch off the engine, disconnect the power and switch on the emergency brake button.

- Place a receptacle that will hold at least 5 liters under the plug.

- Remove the plug (1) and let the oil run out.
  - Deliver the drained oil to special waste handling.

- Top up with new oil in position. 2. See 'Every 500 hours of operation' for filling oil.
Water tank - Cleaning

- Keep in mind that there is a risk of freezing in winter. Drain the tank, pump and lines.

- Drain the tank through the drainage tap (1) alongside the filter.
- Clean the tanks with water and a suitable detergent for plastic surfaces.
- Clean the water filter (2). Fill the tank with water and check that the sprinkler functions.
- The water tanks are made of plastic (polyethylene) and are recyclable.

Fuel tank - Cleaning

- It is easiest to clean the tank when it is almost empty.
- Pump out any bottom sediment using an external pump.
- To remove any additional bottom sediment, fill the tank with two liters of diesel, and then pump it out using the external pump.
- Collect in a container which holds at least 28 liters and deliver to special waste handling.
- Keep in mind fire risk when handling fuel.

- The fuel tank is made of plastic (polyethylene) and is recyclable.
Steering joint - Check

Inspect the steering joint to detect any damage or cracks.

Check and tighten any loose bolts.

Check also for any stiffness and play in the steering joint. Rectify if necessary.
Hydraulic reservoir - fluid change

Use an external drainage pump when draining/emptying the hydraulic reservoir.

⚠️ Risk of burn injuries when draining hot oil. Wear protective gloves and goggles.

Unscrew the tank cap. Place the pump's suction hose in the filler/drain outlet in the hydraulic tank. Place the other hose in a container.

⚠️ Use a receptacle that holds at least 15 liters (4 gal).

Start the pump so that it sucks out the fluid from the tank.

Check that the hose to the pump reaches the bottom of the hydraulic reservoir to ensure that as much of the fluid as possible is drained.

Clean the oil and deliver to special waste handling.

Fill up with the recommended hydraulic fluid to the correct level. Replace the cap on the tank and wipe clean.

Change the hydraulic fluid filter, see under heading 'Every 1000 hours of operation'.

Start the engine and operate the various hydraulic functions. Check the level in the reservoir and top off as required.
